NUCLEAR SCIENCE ABSTRACTS

*A semimonthly publication of the USERDA Office of Public Affairs
Published by the ERDA Technical Information Center*

Nuclear Science Abstracts provides the only comprehensive abstracting and indexing coverage of the international nuclear science literature. It covers scientific and technical reports of the U. S. Energy Research and Development Administration and its contractors, other U. S. Government agencies, other governments, universities, and industrial and research organizations. In addition, books, conference proceedings, individual conference papers, patents, and journal literature on a worldwide basis are abstracted and indexed. Each issue of *Nuclear Science Abstracts* includes four indexes: subject, personal author, corporate author, and report number.

The following organizations scan and abstract the nuclear science literature in their respective countries for input to the International Nuclear Information System of the International Atomic Energy Agency. By special agreement, the input to INIS is simultaneously sent to the ERDA Technical Information Center to enhance the timeliness of coverage of that literature in *Nuclear Science Abstracts*.

Atomic Energy of Canada Limited
Australian Atomic Energy Commission

Danish Atomic Energy Commission

Finnish Atomic Energy Commission

French Atomic Energy Commission

Japan Atomic Energy Bureau—Atomic Energy
Research Institute

Commissie Nucleaire Informatieverzorging
(Netherlands)

Institutt for Atomenergi (Norway)

Aktiebolaget Atomenergi (Sweden)

United Kingdom Atomic Energy Authority

Zentralstelle für Atomkernenergie-Dokumentation
(West Germany)

Numerous organizations, societies, and publishers throughout the world provide *Nuclear Science Abstracts* with advance page-proof copy of their publications.

A list of the journals scanned regularly and the abbreviations used appears in the January 15 issue of *Nuclear Science Abstracts* and is supplemented in the July 15 issue. The January 15 issue also describes the scope and arrangement of the subject matter covered in *Nuclear Science Abstracts*. The subject matter covered is also described in TID-4552, *Subject Scope of Nuclear Science Abstracts*, available free from the USERDA Technical Information Center, P. O. Box 62, Oak Ridge, Tennessee 37830. An outline of the subject categories appears in the Contents of each issue.

HOW TO OBTAIN NUCLEAR SCIENCE ABSTRACTS

Nuclear Science Abstracts is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402.

NSA is issued in two volumes per calendar year, one beginning January 15, the other July 15. Each volume consists of twelve issues.

For the two 12-issue volumes, the annual subscription rate is \$121.05 for domestic subscribers and \$151.35 for foreign subscribers. A single issue costs \$5.05 domestic rates or \$6.26 foreign rates. Domestic rates apply to the United States, Canada, Mexico, and Central and South American countries except Argentina, Brazil, Guyana, French Guiana, Surinam, and British Honduras.

Indexes are cumulated for each volume, i.e., on a six-month volume basis. If purchased on an annual subscription basis the two volume indexes are priced at \$44.40 for domestic subscribers and \$55.50 for foreign subscribers.

The volume indexes are also sold separately. Each volume index is priced on the basis of pagination at the time of publication.

AVAILABILITY OF PUBLICATIONS ABSTRACTED

Public availability of all U. S. Energy Research and Development Administration reports is indicated in the report number indexes. The availability of other reports, when known, is also indicated. The availability of some unnumbered reports is given in the abstract.

Dissertations from *Dissertation Abstracts International, Part B* that are included in *Nuclear Science Abstracts* are

available from Xerox University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106.

Information on the availability of the published literature and unpublished conference papers abstracted in *Nuclear Science Abstracts* can be obtained from the USERDA Technical Information Center, P. O. Box 62, Oak Ridge, Tennessee 37830.

SUBJECT INDEX

The subject indexing of literature announced in *Nuclear Science Abstracts* is based on the use of descriptors* selected from a controlled thesaurus of terms. Subject descriptors and qualifiers (subheadings) are selected and presented in the following format:

SUBJECT DESCRIPTOR/QUALIFIER

Title (supplementary information), volume number:abstract number

For example:

REACTOR CONTROL THEORY
See REACTOR KINETICS
REACTOR COOLING SYSTEMS
See also PRIMARY COOLANT CIRCUITS
REACTOR COOLING SYSTEMS/CRACKS
Small cracks in the reactor cooling system.
Availability of US power plants reduced, 31:18739
REACTOR COOLING SYSTEMS/FLUID FLOW
Fluid flow transient interactions with area discontinuities in piping systems, 31:19077 (SAND-74-8025)
Preliminary analysis of temperature and pressure fluctuations in mixing tees with inlet-leg pipe reducers (LMFBR), 31:18767 (ANL-CT-75-19)

The title may be supplemented with additional words, or a phrase, if it appears additional information would be helpful. This title augmentation is routinely used to denote the presence of numerical data tabulations or new values of constants. In cases for which the title contains little or no information related to the subject entry, it may be replaced entirely by the supplementary information. A qualifier is not always required, and in such cases the title will follow the unqualified subject descriptor.

All index entries cite *NSA* volume and abstract numbers; the volume number precedes the colon and the abstract number follows it. Report numbers, where applicable, are included in parentheses after the abstract number. Published literature (journal article or book) can be identified by the absence of a report number.

The descriptors selected for use as subject terms are generally the names of specific materials, things, and processes. To the extent possible, a qualifier is selected to describe the properties, materials, or processes applied to, the subject term.

Index entries are selected to indicate the important ideas and concepts presented in the original literature, rather than words that may appear in the article. Within the available thesaurus terms, indexers select what seems the most probable or logical place to look for typical information. However, users of the index should consider synonymous or closely related terms.

Information is indexed for the greatest use to the greatest number of users. This requires that a topic be indexed using

*The descriptors used for indexing are selected from the thesaurus of the IAEA International Nuclear Information System (INIS). TIC is a major contributor to thesaurus concepts and maintenance. The thesaurus, IAEA-INIS-13, is available from the SERDA Technical Information Center, P. O. Box 62, Oak Ridge, TN 37830.

subject entries that most specifically describe it and not ordinarily its ultimate use. Only the most specific subject entries are made for a given topic. For example, information on the Yankee-Rowe nuclear power plant is indexed using the subject descriptor ROWE YANKEE REACTOR but not NUCLEAR POWER PLANTS, POWER REACTORS, or PWR TYPE REACTORS. To aid the user, narrower term (NT1) relationships are shown in the subject index as "See also" references. For complete broader term and narrower term relationships of descriptors, refer to IAEA-INIS-13. "See" references are incorporated when abbreviated or synonymous terms have been used.

Specific and general examples can be given as guidance, but for complete understanding, a study should be made of subject entry patterns used to index specific information.

The standard indexing patterns used for some specific subject areas follow.

Machine intervention is used to add collections of related entries to the cumulative indexes because of their unique, e.g., BIBLIOGRAPHIES, MEETINGS, and STANDARDS, or special, e.g., BIOLOGICAL RADIATION EFFECTS, CHEMICAL RADIATION EFFECTS, and PHYSICAL RADIATION EFFECTS, nature.

REACTOR TECHNOLOGY

Subject terms for reactors are of three types: (1) specific reactor names, e.g., BEPO REACTOR, INDIAN POINT-1 REACTOR; (2) reactors having a common physics or engineering characteristic, e.g., FBR TYPE REACTORS, SODIUM COOLED REACTORS; and (3) reactors having a common purpose, as POWER REACTORS, RESEARCH REACTORS.

Information on a specific reactor is indexed using the subject descriptor for that reactor name. Information on classes or types of reactor is indexed using subject descriptors for all applicable reactor types. Most of the common types are indexed using an acronym covering their characteristics, e.g., HTGR TYPE REACTORS, LMFBR TYPE REACTORS. The reactor purpose is used as a subject descriptor only if the article being indexed stresses a unique reactor application for other than power production or research and testing, e.g., DESALINATION REACTORS, PROCESS HEAT REACTORS. Where applicable, subject descriptors that name reactor components may be used, e.g., FUEL ELEMENTS, even though the term is also used as a qualifier of a general reactor term. Indexing is provided for materials used in reactor components when the information is peculiar to the material. For example, if the article deals with corrosion of stainless steel in a sodium cooled reactor, STAINLESS STEELS would be chosen as a pertinent subject descriptor.

In general, qualifiers of reactor subject descriptors are of two types. One type expresses reactor characteristics, e.g., REACTIVITY, and the other indicates components, e.g., CONTROL ELEMENTS.

PARTICLE INTERACTIONS OF HIGH ENERGY PHYSICS

Information on particle-particle events is indexed using subject descriptors that name the particles involved. These subject descriptors have the form PION-NUCLEON INTERACTIONS, MESON-BARYON INTERACTIONS, etc. Such terms are constructed so that the lighter particle appears first in the combination.

A citation on cross sections of pion-neutron interactions would be found by referring to the entry PION-NEUTRON INTERACTIONS/CROSS SECTIONS. This is a dual entry of descriptors corresponding to the main heading-subheading combination of a more conventional index. Each citation under this entry will consist of the title of the article or the title with additional informative words.

Subject terms are also provided for specific models and theories. For example, OCTET MODEL, STRONG-COUPLED MODEL, SYMMETRY GROUPS, etc.

CHEMISTRY

Subject descriptors in chemistry are generally names of elements, isotopes, and compounds. Qualifiers designate properties, processes, and reactions as specifically as possible.

Compounds on which there are significant quantities of information in the literature of nuclear science and technology are indexed by using specific descriptors following the nomenclature of the literature, e.g., METHYL IODIDE, TBP, 2-METHYLPROPANE, URANIUM DIOXIDE, etc.

Compounds occurring less frequently are indexed using more general terms or combinations of terms. In such cases all of the descriptors used to describe the compounds may be selected as subject terms or only the ones of main importance. In these cases the complete compound is indicated in either the title or title augmentation. For example, ethyl bromide is indexed using the subject descriptor BROMINATED ALIPHATIC HYDROCARBONS, uranyl acetates is included as URANYL COMPOUNDS, and lithium fluoroberyllates appears as LITHIUM FLUORIDES and BERYLLIUM FLUORIDES.

Terms for chemical reactions, processes, and properties are not used as subject descriptors in indexing information on specific materials. Such terms are included for publications such as books, reviews, or general treatment of the subject.

LIFE SCIENCES

Information in this area is indexed using subject descriptors for specific animals, plants, microorganisms, biochemicals, biological systems and processes, cells, organs, radiation effects, and substances modifying radiation effects. DNA, BARLEY, HELA

CELLS, BEAGLES, PATIENTS, BACILLUS SUBTILIS, LACTATE DEHYDROGENASE, and CHROMOSOMAL ABERRATIONS are examples of specific subject descriptors. While most descriptors are common names, genus and species names are sometimes used, e.g., DROSOPHILA. If the specific name of an organism or biochemical is not used, the name of a higher category is used instead. For example, clams are indexed using the subject descriptor MOLLUSCS, Anopheles pharoensis using MOSQUITOS, and glutamine oxalacetic acid transaminase using TRANSFERASES. Title augmentation is used to more completely identify the organisms or substances.

Subject descriptors naming incident radiation are used only if dose, RBE, or other radiation quality studies are made.

INSTRUMENTATION

Information in the field of instrumentation technology is indexed using the most specific subject descriptors available for the instrument, instrument component, or instrument application. Qualifiers of subject descriptors are selected to indicate the attribute, characteristic, or component studied, e.g., MASS SPECTROMETERS/PERFORMANCE, LI-DRIFTED GE DETECTORS/SENSITIVITY, GAMMA SPECTROMETERS/LI-DRIFTED GE DETECTORS, THICKNESS GAGES/ACCURACY, INTEGRATED CIRCUITS/PHYSICAL RADIATION EFFECTS, etc. In those cases where the application is indexed, a qualifier is selected to indicate the instrument used in the study, e.g., GAMMA DETECTION/LI-DRIFTED GE DETECTORS and NEUTRON DOSIMETRY/THERMOLUMINESCENT DOSEMETERS.

MATERIALS

Subject descriptors for materials are the names of particular materials, elements, alloys, etc. These descriptors are usually modified by secondary terms such as MECHANICAL PROPERTIES, HEAT TREATMENTS, SUPERCONDUCTIVITY, MICROSTRUCTURE, or PHASE TRANSFORMATIONS.

Multicomponent materials such as alloys are indexed by entering separate descriptors for each component. For example, information on a Cr-Mo-V alloy would be indexed using the three entries CHROMIUM ALLOYS, MOLYBDENUM ALLOYS, and VANADIUM ALLOYS, each being qualified by a secondary descriptor as appropriate. Some alloys such as STAINLESS STEEL-304, INCONEL 600, HASTELLOY X, are named in the index. For these cases indexing for the individual components is not entered, but cross references from the general terms to these named alloys is provided. For example, the reference *Tungsten Alloys*, See also *Hastelloy X* might be found in a given issue, as well as cross references from all the other components of Hastelloy X.
